Abstract

Nowadays, data is collected from different sources such as Excel files, databases, websites, and online applications. Since this data is stored in different formats, it becomes difficult to analyze and use effectively. The Multi-Source Data Integration Pipeline project helps combine data from multiple sources into one system.

In this project, data is collected, cleaned, and transformed into a common format. The system removes duplicate records, handles missing values, and integrates all the data into a single database. This process reduces manual work and improves data quality.

The integrated data can be used for reporting, visualization, and decision-making. This project helps organizations manage data more efficiently and provides accurate information for analysis. It demonstrates the importance of data integration in today's data-driven world.
